

June 12-13, 2010

Global Environmental Problems issue have a variety of problems affecting our entire lives from past to present to future time. As globalization continues and the earth's natural processes transform local problems into international issues, very few societies are being left untouched by major environmental problems. Some of the problems now affecting the world are Acid Rain, Air Pollution, Global Warming, Hazardous Waste, Ozone Depletion, Smog, Water Pollution, Overpopulation, and Rain Forest Destruction

By the way, I have always thought these environmental problems not far from my daily life. I always asked myself "Why we have to solve these problems." Now I have already changed my attitude because if I live and do nothing, it is just waiting for the world to be ruined. We can start from our daily lives by purchasing products from industries that have standard treatment systems. We should support agriculturists by buying organic products. Even though it is expensive more than inorganic products but good for healthy and also preserve environmental because they do not use chemicals. This is a concrete object and we know the effect.

In Thailand we have a many institute for research organic plants. To develop genetics for resisting with diseases and acclimatize to environmental. They give newly-developed seed and to disseminate knowledge to agriculturists. Though organic method that is new for agriculturists but I think everyone can learn. It may be difficult do but we have to be a part of the world to reduce global warming. I would like to see everyone taking care of environmental resources and saving energy. If the world has a good environment that will result in happiness and to shows sustainability in the present and future.

I have had good experience on this trip. I studied rice planting and to discussed with other persons. I like to listen opinions. I am happy and I would like to join next field trip.
